BAZZAZ HARNESS CONNECTOR IDENTIFICATION

FUEL HARNESS

Read through all instructions before beginning installation. This is not a replacement for the ECU. This document is intended for use by qualified technicians. Refer to a factory service manual for more specific stock component identification and location information.

WE STRONGLY SUGGEST THAT AN EXPERIENCED TECHNICIAN INSTALL THIS BAZZAZ PRODUCT

1. Start by removing seat and tank panels.

2. Using the supplied Velcro patch, secure the Bazzaz **CONTROL UNIT** in the tail section and connect the main connector of the Bazzaz **FUEL HARNESS** to control unit. Begin routing the harness forward, towards the engine on the right side of the motorcycle.

3. Locate the factory tail sub-harness connectors found just below the fuse box; disconnect the factory tail sub-harness connectors, and connect the Bazzaz **+12V SWITCHED POWER** connectors in-line with the factory connectors.

Factory tail sub-harness connectors

Factory injector connector (not shown in photo)

4. Now locate the factory fuel **INJECTOR** and connector in the center of the bike, under the airbox. Disconnect the injector connector and plug the Bazzaz injector connectors in-line between the factory connector and injector.

Bazzaz injector connectors

5. Locate the factory Throttle Position Sensor (**TPS**) and connector on the right side of the throttle body. Disconnect the TPS connector from the sensor and connect the Bazzaz TPS connectors in-line, between the factory connector and sensor.

Bazzaz TPS connectors

6. Route the Bazzaz Crank Position Sensor (**CKPS**) lead down the right side of the motorcycle, between the frame and the motor, and to the area above the clutch cover. Remove the guard to gain access to the factory CKPS connectors; plug the Bazzaz CKPS connectors in-line between the factory CKPS connectors. Replace the guard that was removed.

7. Now route the Bazzaz **GROUND** lug forward, to the front of the bike, running it under the airbox and up to the battery. Secure the Bazzaz ground lug to the negative terminal on the battery.

8. Now you will need to eliminate the factory **O2/ LAMBDA SENSOR**, as this sensor will no longer be used. The sensor connector is a round four-pin connector, found attached to the right side of the frame and under the skid plate. Simply disconnect the connectors; the wires should be neatly secured away from any moving components, or the sensor may be removed and the remaining port/bung in the exhaust can then be plugged.

Accessories you may be interested in to ENHANCE your Bazzaz experience

Z-AFM™ | Tuning Technology (for use with all Bazzaz fuel control units)

Quickly collect data to build ideal, self-made fuel maps while riding. [Part No. 127062]

Map Select Switch (for use with the Z-Fi, Z-Fi MX, Z-Fi QS and Z-Fi TC)

The Bazzaz Map Select Switch is a handlebar-mounted switch for convenient toggling between two maps held on the Bazzaz unit. For example, rider can toggle between a fuel efficient map, rain map, or a full power map. [Part No. 127078]
